```
I'm using the `multi-agent-orchestrator` skill because this rewrite benefits from
↪  parallel source preservation, mathematical framing, and independent academic
↪  verification. I'll delegate the actual file writing and require an architect-style
↪  review before calling it complete.

The work is split into three non-overlapping tracks: a preservation audit of the
↪  student's prose, a LaTeX/project-convention audit, and a scholarly framing audit for
↪  Goodman, Kuhn, observer-dependent geometry, and the JL lemma. No agent will edit the
↪  target files until these inputs are reconciled.

The repository already contains an untracked `paper/latex/main.tex`, so I'm treating it
↪  as potentially user-authored and will inspect it before any writer replaces or
↪  extends it. The worktree also has many unrelated changes; those remain strictly out
↪  of scope.

The local shell is unusually slow while reading the untracked LaTeX file, but the three
↪  delegated audits are continuing independently. I'm not changing permissions or
↪  touching unrelated files; I'll use the audit results if this read remains stalled.

\title{Aligned Perspectival Kernel Projections and Bias Reification}
\author{Andrew Clair \\ Student Number: 22184813 \\ Supervisor: Henry Silke \\ Module:
↪  JM4018 - INDIVIDUAL JOURNALISM PROJECT 2025/6 SEM2}
\date{March 4, 2026}

\begin{document}

\maketitle

\begin{abstract}
```

```
This paper outlines a multistage, zero-shot Natural Language Inference (NLI)
↪  architectural approach towards large scale data classification. It relies on a
↪  Riemannian metric as a means of formalizing semantic geometry, investigating how
↪  perspectival limits shape discourse. By moving beyond traditional horizontal scaling
↪  and extrinsic bias metadata, we propose a vertical pipeline built on Homotopy Type
↪  Theory and the Johnson-Lindenstrauss lemma. Through empirical telemetry and
↪  topological diagnostics, we demonstrate that semantic structure is robust but
↪  intrinsically observer-dependent, effectively disproving the fiction of objective
↪  neutrality in automated media analysis.
\end{abstract}

\end{document}

The source boundary is now clear: the original combined section spans lines 21-182. I've
↪  also asked the preservation analyst to cross-check later uses of "Ground News
↪  effect," "golden middle," and observer-dependent geometry so the new opening remains
↪  consistent with the paper's own later vocabulary without prematurely importing
↪  results.

The preservation audit is complete and confirms all eight original argumentative moves
↪  can be retained while substantially expanding the section. A key safeguard emerged:
↪  the JL lemma must be presented as a distance-preservation constraint and motivation
↪  for dimensional adequacy-not as proof that semantics is inherently
↪  high-dimensional-and Topos/HoTT must be framed as formal organizing resources, not as
↪  an off-the-shelf classifier.
```

The audits are reconciled. The writer now has sole ownership of the two requested files and will produce a self-contained, compilable foundation: the combined section will be substantially expanded, all original substantive points retained, the philosophical claims qualified where needed, and a manual bibliography embedded in `main.tex` so the new citations do not depend on a missing `.bib` file.

The integrated draft is in progress. The writer is using a preservation checklist rather than paraphrasing from memory, with explicit static checks planned for citation-key coverage, balanced environments, missing inputs, and LaTeX escaping because no TeX engine is installed in this workspace.

The writer is still composing the full section; there is no blocker reported. I've kept the assignment exclusive to avoid overlapping edits, and the next step remains independent validation rather than immediate handoff once the first draft lands.

The draft remains underway; the requested density is substantial, so I'm allowing the writer to finish the full argument rather than truncating it to meet a short turnaround. The verification rubric is already fixed: source preservation, conceptual precision, mathematical correctness, citation completeness, and a standalone LaTeX entry point.

The full `01_introduction.tex` draft is now on disk. The writer is finishing `main.tex` and running the promised static checks; after that, I'll hand the two-file result to a fresh reviewer with authority to reject it against the original directives.

Both requested files are now written. The remaining delay is the Windows sandbox's slow read/check cycle, not drafting; I've told the writer to stop after essential static validation so the independent review can begin promptly.

The drafting agent's slow post-edit check has been interrupted cleanly; the edits remain in place. I'm now running two independent read-only reviews in parallel: one for LaTeX integrity/citation coverage and one architect review against every substantive directive and the original source.

task-3914.log

I'm using the `multi-agent-orchestrator` skill because this rewrite splits cleanly into source-faithfulness, mathematical formalization, and LaTeX-integration tracks. I'll have a separate architect verify the finished section before I report completion.

Skills used: multi-agent-orchestrator.

The three parallel reviews are underway: one is safeguarding all eight framing pairs, one is building the formal mathematics with explicit modeling caveats, and one is checking the paper's LaTeX and bibliography conventions. No agent is editing the target yet, so the source of truth stays stable during analysis.

I'm holding the target file untouched until the source and mathematics briefs converge. The key quality check here is separating what the experiment actually computes from the HoTT/manifold language used to interpret it, so the paper gains rigor without claiming that a theorem was empirically measured when it was only a formal model.

The exact eight pairs are now captured with their original IDs, A/B hypotheses, descriptions, and order. I'm preserving them verbatim in substance; the expansion will surround those examples with formal definitions rather than rewriting their political framing.

```
The document preamble already supports the needed equations (`amsmath`, `amssymb`,
↪  `amsthm`) and includes `02_methodology.tex` directly. There is no active
↪  bibliography, so I'm keeping the section self-contained and avoiding unresolved
↪  citation commands unless an existing key is confirmed.

The source and formalism reviews have converged. I'm now handing the single target file
↪  to a dedicated writer/executor with exact ownership. The reconciliation will
↪  explicitly distinguish: 16 hypothesis-conditioned passes (48 logits) from an
↪  eight-pair, three-label contrast channel (24 values); RKS kernel approximation from
↪  JL distance preservation; HoTT identity paths from metric geodesics; and Procrustes
↪  alignment from the continuous path it induces.

The implementation draft is in progress now. I've also confirmed the repository currently
↪  lacks the other three section fragments, so a full `main.tex` build cannot succeed
↪  independently of this task; verification will use a standalone harness for the
↪  methodology fragment, then separately report the pre-existing missing-input
↪  limitation.

I'm letting the draft run long enough to do the requested expansion properly. The
↪  intended structure is now fixed: experimental setup and corpus, the eight unaltered
↪  dialectical gates, representation/projection definitions, five formal tracks, then a
↪  limitations paragraph that clearly separates empirical computations from formal
↪  idealizations.

The writer has the complete source map and formal definitions. I'm monitoring for
↪  file-access contention-the same environment delay affected earlier read-only
↪  checks-but there is no scope or content blocker at this point.

The first writing pass failed to checkpoint a file despite having the specification, so
↪  I'm stopping that stalled turn and reassigning the implementation cleanly. This does
↪  not lose repository work-the target is still absent-and avoids waiting on an
↪  unresponsive drafting process.
```

task-3915.log

```
I'm using the `multi-agent-orchestrator` skill because this rewrite benefits from
↪  parallel source extraction, telemetry verification, and LaTeX-convention review. I'll
↪  delegate the actual drafting/editing, then have a separate architect-style agent
↪  verify the result before I report completion.

Skills used: `multi-agent-orchestrator`.

The first repository read exposed a path mismatch in the managed shell rather than a
↪  document problem. I'm resolving the workspace mapping now while the three delegated
↪  source reviews continue in parallel.

The target file does not yet exist; `paper/latex/` currently contains only `main.tex`, so
↪  this will be a clean creation rather than an overwrite. The worktree also contains
↪  extensive unrelated user changes, which I'm leaving untouched and explicitly
↪  excluding from the delegated edit scope.

The parallel reviews are still working through a large diagnostics tree. I've narrowed
↪  their priority to the exact reported statistics, topological outputs, and the
↪  methodology pair names so the rewrite stays evidence-based rather than merely
↪  expansive.
```

```
One older summary (`final_thesis_metrics.md`, July 7) predates the requested 12-hour
↪ diagnostics and explicitly marks some claims as not yet control-safe. I'm treating it
↪ as historical context only and requiring the rewrite to ground the new \(p\), \(d\),
↪ and Naturality claims in the newer artifacts before they are stated.

The manuscript audit confirms the eight \(A-B\) methodology pairs are joint measurement
↪ axes, not eight separately significant tests. The rewrite will therefore connect the
↪ aggregate statistical/topological validation to all eight pairs while avoiding
↪ unsupported pair-specific \(p\)-values or ideological conclusions.

The newer topology artifacts validate the headline contrast but reveal an important
↪ nuance: real Naturality is \(0.984\)-\(0.994\), constant-control Naturality is about
↪ \(0.544\)-\(0.546\), while shuffled-label Naturality is also high
↪ (\(0.988\)-\(0.992\)). I'll present Naturality as evidence of neighborhood
↪ preservation versus degenerate embeddings-not as a label-semantic discriminator by
↪ itself.

The statistics audit found a provenance issue that materially changes the academic
↪ wording: \(p=6.3\times10^{-93}\) and \(d=20.05\) are reproduced exactly by
↪ `scripts/run_reviewer_sweep.py`, but that script explicitly generates simulated
↪ normal samples "for demonstration"; they are not computed from the 12-hour corpus
↪ artifacts. I will still document them in the Results section, but clearly as a
↪ calibration result rather than empirical proof, and I'm deriving the defensible
↪ corpus comparison from the actual `path_metrics.json` files.
```

task-3916.log

```
Skills used: none (reason: no available skill specifically covers scholarly LaTeX
↪ rewriting; the DOCX skill does not apply).

I'm delegating source extraction, theoretical scrutiny, and LaTeX-convention review in
↪ parallel. After that, a writing agent will implement the section and an independent
↪ architect will verify both the argument and the compiled form.
  → Inspect the source Discussion, project evidence, and LaTeX conventions in parallel
  • Delegate the expanded Discussion rewrite to a writing agent
  • Run LaTeX and content verification
  • Obtain independent architect approval and address any findings

The three review tracks are in progress. I'm also checking the local toolchain;
↪ filesystem reads are unusually slow in this session, so I'm keeping the work
↪ distributed and will base the rewrite on independently recovered source details
↪ before any edit is made.

The source Discussion has now been recovered. Its strongest existing thread is worth
↪ preserving: consensus is not semantic clarity, measurement can manufacture the
↪ structure it reports, and failed attempts to force semantics onto a fixed axis
↪ exposed resistance in the learned geometry. I'm using that as the bridge to the
↪ stronger "objective center" conclusion, while keeping mathematical claims carefully
↪ scoped.

The argument is converging around a crucial distinction: HoTT/topos theory can supply the
↪ formal vocabulary for local, perspective-indexed meaning, but the paper's empirical
↪ Naturality measurements supply the evidence for this particular system. The rewrite
↪ will state the "death of the objective center" as the study's philosophical
↪ consequence-not mislabel it as a standalone theorem.
```

```
The writing agent now has the full brief. One important safeguard is built into it: the
↪ Naturality diagnostic will support invariance of relationships under transport, while
↪ the absence of a canonical center will be argued from observer-conditioned geometry.
↪ That preserves the requested conclusion without turning a near-tautological metric
↪ into evidence it cannot provide.

The draft is being written now as a self-contained LaTeX fragment. Its structure moves
↪ from measurement-as-constitution, through observer-dependent transport and the Ground
↪ News critique, to a conclusion that rejects both a neutral centroid and "anything
↪ goes" relativism.

The writer has completed the source and evidence pass and is drafting the full section
↪ now. No blocker has surfaced; the only file in scope remains
↪ `paper/latex/04_discussion.tex`.

The prose is at the final drafting stage. I've asked the writer to commit the coherent
↪ version now at the lower end of the expansion range, so verification can begin rather
↪ than spending time on cosmetic polishing.

The first full draft is in place at 2,812 words. I'm now running two independent checks
↪ in parallel: one for LaTeX validity and one for philosophical/empirical fidelity,
↪ including whether every directive is satisfied without overstating Naturality, HoTT,
↪ or topos theory.
```
